1. Executive Summary

TaxiSphere is a cloud-native, multi-tenant SaaS platform designed to modernize taxi association operations through secure, scalable, and well-governed software.

This document defines the official documentation and branding standard for TaxiSphere. It establishes the rules for document structure, naming, versioning, repository organization, diagram conventions, traceability, and quality expectations.

The goal is to make every TaxiSphere artifact consistent, professional, maintainable, and suitable for use in an enterprise engineering environment.

2. Purpose

The purpose of this standard is to ensure that all TaxiSphere documents and engineering artifacts follow a common structure and visual identity.

This standard supports:

- Consistent documentation across the platform.
- Clear ownership and document control.
- Professional presentation for stakeholders.
- Traceability from business goals to implementation.
- Easier onboarding for future contributors.
- Stronger governance over engineering decisions.

3. Scope

This standard applies to all TaxiSphere project artifacts, including:

- Governance documents.
- Business documents.
- Requirements documents.
- Architecture documents.
- Domain model documents.
- Database design documents.
- API specifications.
- Frontend and backend design documents.
- Security documents.
- Testing documents.
- Operations and deployment documents.
- Architecture Decision Records.
- GitHub repository files.
- Diagram assets.
- Templates.

4. Product Identity

Property	Value
Product Name	TaxiSphere
Full Product Name	TaxiSphere Enterprise Mobility Platform
Product Code	TS
Product Type	Enterprise Cloud Platform
Product Category	Mobility Technology
Deployment Model	Multi-Tenant SaaS
Initial Region	South Africa
Expansion Strategy	Africa
Target Customers	Taxi associations and transport operators

5. Corporate Identity

Property	Value
Company Name	Sphere Technologies (Pty) Ltd
Business Domain	Enterprise Software
Product Division	Mobility Solutions
Engineering Organization	TaxiSphere Engineering

Primary Platform	TaxiSphere Enterprise Mobility Platform
------------------	---

6. Brand Standards

6.1 Brand Personality

TaxiSphere should feel:

- Professional.
- Reliable.
- Secure.
- Modern.
- Operationally focused.
- Easy to understand.

The brand should avoid overly playful language in formal documents. Engineering documents must be clear, concise, and defensible.

6.2 Color Palette

Color	Usage	Meaning
Azure Blue	Primary brand color	Trust, technology, cloud readiness
Emerald Green	Secondary color	Growth, mobility, success
Orange	Accent color	Movement, urgency, transport operations
Dark Gray	Text and UI foundations	Professional structure
Light Gray	Backgrounds and separators	Calm visual hierarchy
White	Document and interface base	Simplicity and clarity

Exact hex values will be finalized in the TaxiSphere Brand Guide.

6.3 Typography

Usage	Font
Formal documents	Aptos or Calibri
Web application	Inter
Source code	JetBrains Mono or Consolas
Diagrams	Inter or Aptos

6.4 Logo Usage

The official TaxiSphere logo will be stored under:

`assets/branding/logos/`

Future versions of this standard will define:

- Primary logo.
- Dark background logo.
- Light background logo.
- Product icon.
- Favicon.
- Minimum clear space.
- Incorrect logo usage.

7. Documentation Standards

Every controlled TaxiSphere document must include:

- Cover page or metadata block.
- Document control table.
- Revision history.
- Approval section.
- Table of contents.
- Executive summary.
- Purpose.
- Scope.
- Main content.
- References.
- Glossary, where relevant.
- Appendices, where relevant.

Documents should be written in clear professional language. Requirements and decisions must be specific enough for engineering, testing, and review.

8. Document Numbering

8.1 Document ID Format

TaxiSphere documents use the following format:

`TS-XXX-###`

Where:

Segment	Meaning
TS	TaxiSphere

XXX	Document category
###	Sequential number

8.2 Official Document Categories

Document	ID
Documentation and Branding Standard	TS-STD-001
Engineering Handbook	TS-ENG-001
Product Vision and Strategy	TS-VSN-001
Project Charter	TS-CHR-001
Business Requirements Document	TS-BRD-001
Software Requirements Specification	TS-SRS-001
Software Architecture Document	TS-SAD-001
Domain Model Specification	TS-DMS-001
Database Design Specification	TS-DDS-001
API Design Specification	TS-ADS-001
UI/UX Specification	TS-UXS-001
Security Architecture	TS-SEC-001
Test Strategy	TS-TST-001
Operations and Deployment Guide	TS-OPS-001

9. Versioning Standard

TaxiSphere documents use semantic versioning:

`Major.Minor.Patch`

Version Change	Meaning	Example
Major	Significant restructure or scope change	2.0.0

Minor	New section or material content added	1.1.0
Patch	Typo, formatting, or minor correction	1.0.1

10. Status Workflow

Controlled documents must use one of the following statuses:

Status	Meaning
Draft	Work in progress and not yet approved
Under Review	Ready for stakeholder review
Approved	Accepted as the official baseline
Published	Released for wider use
Archived	Retired or replaced by a newer document

11. Repository Standards

The TaxiSphere repository should use this top-level structure:

```
TaxiSphere/
.github/
assets/
backend/
decisions/
docker/
docs/
frontend/
infrastructure/
kubernetes/
research/
samples/
scripts/
terraform/
tools/
README.md
```

This structure separates documentation, source code, infrastructure, project assets, and research material.

12. Folder Standards

The `docs/` folder should use the following structure:

```
docs/
  00-Governance/
  01-Business/
  02-Requirements/
  03-Architecture/
  04-Domain/
  05-Database/
  06-API/
  07-Frontend/
  08-Backend/
  09-Security/
  10-Testing/
  11-Operations/
  12-Deployment/
  13-Engineering-Handbook/
  14-ADR/
  15-Research/
  16-Templates/
  17-Wiki/
  18-Release-Notes/
  19-Compliance/
  20-Training/
```

Governance standards should be stored under:

```
docs/00-Governance/Standards/
```

13. Naming Conventions

13.1 Documents

Document filenames should follow this pattern:

```
DocumentID-Readable-Title.md
```

Example:

```
TS-STD-001-Documentation-and-Branding-Standard.md
```

13.2 Requirements

Requirement Type	Format
Business Requirement	BR-001
Functional Requirement	FR-001
Non-Functional Requirement	NFR-001
Use Case	UC-001
Business Rule	RULE-001
Test Case	TC-001

Module-specific requirements may include a module prefix:

```
FR-AUTH-001
FR-TENANT-001
FR-DRIVER-001
```

13.3 Architecture Decision Records

ADR filenames should follow this pattern:

```
ADR-###-Short-Decision-Title.md
```

Example:

```
ADR-001-Multi-Tenant-SaaS-Architecture.md
```

13.4 Branches

Git branches should follow these patterns:

```
main
develop
feature/short-description
bugfix/short-description
hotfix/short-description
release/v1.0.0
docs/short-description
```

14. Markdown Standards

Markdown is the source of truth for TaxiSphere documentation.

Word and PDF files are treated as published artifacts generated from Markdown where practical.

Markdown documents should:

- Use front matter for metadata.
- Use consistent heading levels.
- Use tables for structured information.
- Use relative links between project documents.
- Use Mermaid diagrams for lightweight diagrams.
- Keep one topic per section.
- Avoid duplicated information where cross-references are better.

15. Diagram Standards

Diagram Type	Standard
System Context	C4 Model
Container	C4 Model
Component	C4 Model
Deployment	UML Deployment

Sequence	UML Sequence
Activity	UML Activity
Use Case	UML Use Case
Business Process	BPMN 2.0
Entity Relationship	Crow's Foot ERD

Approved diagram tools:

Tool	Usage
Mermaid	Lightweight Markdown diagrams
PlantUML	Version-controlled UML diagrams
diagrams.net	Architecture, ERD, and process diagrams
Figma	UI/UX design

16. Traceability Standards

TaxiSphere uses end-to-end traceability to connect business intent to implementation.

Every major feature should trace through this lifecycle:

```

Business Goal
-> Business Requirement
-> Functional Requirement
-> Use Case
-> Business Rule
-> Architecture Decision
-> API Contract
-> Database Design
-> Frontend Screen
-> Backend Module
-> Test Case
-> Deployment and Monitoring

```

Implementation should not begin for major features until the business requirement, functional requirement, and acceptance criteria are defined.

17. Quality Standards

Every TaxiSphere artifact should be:

- Correct.
- Complete.
- Consistent.
- Verifiable.

- Traceable.
- Maintainable.
- Secure.
- Easy to review.
- Suitable for future contributors.

18. Approval Workflow

Controlled documents follow this approval workflow:

Draft

- > Technical Review
- > Business Review
- > Architecture Review
- > Approved
- > Published

For lightweight internal documents, Technical Review and Architecture Review may be combined.

19. Document Lifecycle

Every controlled document follows this lifecycle:

22. Create the draft.
23. Review the content.
24. Update based on feedback.
25. Approve the baseline.
26. Publish the artifact.
27. Maintain the document as the product evolves.
28. Archive the document when it is replaced.

20. References

TaxiSphere documentation may align with the following standards where useful:

- IEEE 29148, requirements engineering.
- IEEE 1016, software design descriptions.
- OpenAPI 3.1.
- C4 Model.
- UML 2.x.
- BPMN 2.0.
- OWASP ASVS.
- OWASP Top 10.
- Twelve-Factor App.
- Semantic Versioning 2.0.0.

21. Glossary

Term	Definition
ADR	Architecture Decision Record. A short document that records an important technical decision and its reasoning.
Artifact	A project output such as a document, diagram, template, code module, or specification.
SaaS	Software as a Service. A software delivery model where customers use a shared hosted platform.
Tenant	A taxi association or organization using TaxiSphere with logically isolated data.
Traceability	The ability to connect business goals, requirements, design, implementation, and tests.
Controlled Document	A document with an owner, version, status, and approval process.

Appendix A: Future Standards

The following standards should be created as TaxiSphere matures:

ID	Document
TS-COD-001	Coding Standard
TS-GIT-001	Git Workflow Standard
TS-API-001	REST API Standard
TS-SEC-002	Secure Development Standard
TS-TST-002	Testing Standard
TS-OBS-001	Observability Standard
TS-UI-001	Design System Standard
